The Norovirus is going around!

Right now in Pawsville, the biggest news is about the Norovirus outbreak that has affected many cats. The Norovirus is known to cause vomiting and diarrhea, and that makes it a very hard virus for many cats. Currently, the number of cats infected stands at around thirty, and a dozen kittens have also had it.

Rudy, Blackspots, and their kittens all caught the Norovirus recently. First it was Rudy, who then spread it to her kittens, who spread it to Blackspots. Luckily, Blackspots didn't catch the Norovirus until Rudy had recovered, so they could both take turns taking care of their kittens. Due to

the recent illness in the house, Rudy has added some air fresheners around the house, because it reeked of stuff that we don't care to name again. But Rudy's kittens are using the fact that they have already had the Norovirus to their advantage, and they are scaring other kittens with graphic details about their bouts of vomiting and diarrhea.

Rudy has made a point to tell Judy that the Norovirus is one of the worst things that she has ever experienced, and that Judy would think so too when she caught it. However, Judy has already resolved not to catch the Norovirus, and she is quarantining in her house with boards over the doors and windows. Lunch has temporarily closed her Luncheon so that she and her employees are not at risk from the Norovirus. Lunch and her kittens are doing a makeshift quarantine as well, because Lunch has heard too much about the Norovirus, and therefore does not want to catch it.

While some cats worry about not catching the Norovirus, others wonder where it came from. Right now, a lot of cats are searching up answers to their questions on the internet, and certain facts have been exposed. You could catch the Norovirus from accidentally consuming your own feces, or you could have gotten it from consuming a certain type of food. Foods commonly known to harbor the Norovirus include leafy greens, fresh fruit, and shellfish.

“I know that I’ll get the Norovirus in the next few days.”

- JULIET, WHOSE KITTENS HAVE THE NOROVIRUS ALONG WITH BLACKPELT

A lot of cats have said that they were eating romaine lettuce recently, a leafy green that was part of a new shipment of food to the grocery store. Many cats agree that this might have been the cause of the Norovirus, and right now scientists are bringing some of the new romaine lettuce into their lab for testing. Today the results of the test came back, showing that the lettuce was positive for carrying traces of Norovirus. The remaining lettuce at the grocery store has been taken away and burned.
